

“Of course my agent
is safe...
it is, right?”

An AI agent deleted a live database

Replit’s agent deleted SaaStr’s live application database during an explicit code freeze, despite instructions to make no changes.

1,206 executive records deleted

Source: [SaaStr’s firsthand incident account](#)

Meme illustration, not an actual agent quote.

The control gap

An agent can use valid credentials and still act outside the scope of its task.

TASK BOUNDARY

No production changes

The user's instruction restricts what the agent should do.

| Enforce task policy before the tool executes.

SYSTEM PERMISSIONS

Production writes allowed

The tools and credentials still let the agent perform the prohibited action.

Cogut

Secure non-deterministic workflows
Keep developers focused on building.

Security and control

Central policy

- One policy for models and tools
 - Validated updates without a restart
-

Hybrid guardrails

- Fast checks for PII, secrets and attacks
- Semantic checks on suspicious requests

Visibility

Budget governance

- Token and spend limits per user/model
 - Soft limits warn; hard limits block
-

Monitoring

- Decisions traced to policy versions
- Tamper-evident audit and latency metrics

How Cogut works

Block the action. Help the agent recover.

01 / ENFORCE

Block

The gateway rejects an unauthorized request.

02 / EXPLAIN

→ Guide

An LLM explains the actual policy violation.

03 / RECHECK

→ Retry

The agent can propose a permitted alternative.

— Every revised request faces the same controls.

Shared protections. Profiles that fit the work.

SECURITY LEADERSHIP

Set the boundaries

Mandatory controls across security categories.

PRINCIPAL ENGINEERS & TEAM LEADS

Configure the profiles

Tailor permissions and limits within those boundaries.

Developers Build with approved profiles.

The Fantastic Four is the past. The Great Five is the future.

Confidence to give AI more responsibility.

Your organization defines the boundaries.
Our control layer enforces them.

Let's discuss where this fits in your AI workflows.
